AutoML and Feature Engineering Tools

- AutoML Platforms
  - Commercial Platforms
    - Google Cloud AutoML
      - AutoML Vision
        - Image classification
        - Object detection
        - Image segmentation
      - AutoML Natural Language
        - Text classification
        - Entity extraction
        - Sentiment analysis
      - AutoML Tables
        - Structured data processing
        - Automatic feature engineering
        - Model selection and tuning
      - AutoML Video Intelligence
        - Video classification
        - Object tracking
        - Action recognition
    - Microsoft Azure AutoML
      - Azure Machine Learning Studio
        - Drag-and-drop interface
        - Code-free model building
        - Automated pipeline creation
      - Automated ML Capabilities
        - Classification tasks
        - Regression problems
        - Time series forecasting
      - Integration Features
        - Azure DevOps integration
        - Power BI connectivity
        - REST API deployment
    - Amazon SageMaker Autopilot
      - Core Features
        - Automatic data preprocessing
        - Algorithm selection
        - Hyperparameter optimization
      - Model Insights
        - Feature importance rankings
        - Model performance metrics
        - Explainability reports
      - Deployment Options
        - Real-time endpoints
        - Batch transform jobs
        - Multi-model endpoints
  - Open-Source Frameworks
    - H2O AutoML
      - Supported Algorithms
        - Gradient Boosting Machines (GBM)
        - Random Forests
        - Deep Neural Networks
        - Stacked Ensembles
      - Key Features
        - Automatic data visualization
        - Leaderboard generation
        - Model interpretability tools
      - Language Support
        - Python API
        - R interface
        - Flow UI (web-based)
    - AutoGluon
      - Task Types
        - Tabular prediction
        - Image classification
        - Text classification
        - Object detection
      - Advanced Capabilities
        - Multi-layer stack ensembling
        - Neural architecture search
        - Transfer learning
      - Resource Management
        - Time-based constraints
        - GPU acceleration
        - Distributed training
    - Auto-sklearn
      - Meta-Learning
        - Warm-starting with similar datasets
        - Bayesian optimization
        - Ensemble construction
      - Pipeline Components
        - Data preprocessing
        - Feature preprocessing
        - Classification/Regression
      - Constraints
        - Time limits
        - Memory limits
        - CPU usage limits
- Feature Engineering Tools
  - Automated Feature Engineering
    - Featuretools
      - Deep Feature Synthesis
        - Aggregation primitives
        - Transformation primitives
        - Custom primitive creation
      - Entity Sets
        - Relationship definitions
        - Time-based features
        - Multi-table operations
      - Integration
        - Pandas compatibility
        - Dask support
        - PySpark integration
    - TSFresh
      - Time Series Features
        - Statistical characteristics
        - Frequency domain features
        - Non-linear characteristics
      - Feature Selection
        - Hypothesis testing
        - Feature relevance scoring
        - Multiple testing correction
      - Scalability
        - Parallel processing
        - Distributed computing
        - Memory optimization
    - AutoFeat
      - Feature Construction
        - Non-linear transformations
        - Feature combinations
        - Polynomial features
      - Selection Methods
        - L1 regularization
        - Random forest importance
        - Correlation analysis
      - Model Types
        - Linear models
        - Tree-based models
        - Neural networks
  - Feature Selection Tools
    - Scikit-learn Methods
      - Filter Methods
        - Variance threshold
        - Chi-square test
        - Mutual information
      - Wrapper Methods
        - Recursive feature elimination
        - Sequential feature selection
        - Exhaustive feature selection
      - Embedded Methods
        - LASSO regularization
        - Tree-based importance
        - Regularized linear models
    - Boruta
      - Shadow Features
        - Random permutation
        - Statistical testing
        - Iterative selection
      - Algorithm Support
        - Random Forest
        - XGBoost
        - LightGBM
      - Output Types
        - Confirmed features
        - Tentative features
        - Rejected features
    - SHAP (SHapley Additive exPlanations)
      - Feature Importance
        - Global interpretability
        - Local interpretability
        - Interaction effects
      - Visualization Tools
        - Summary plots
        - Dependence plots
        - Force plots
      - Model Support
        - Tree-based models
        - Deep learning models
        - Linear models
- Core Components and Processes
  - Data Preprocessing
    - Missing Value Handling
      - Imputation strategies
      - Pattern detection
      - Missingness indicators
    - Automated Cleaning
      - Outlier Detection
        - Statistical methods
        - Isolation forests
        - Local outlier factor
      - Data Type Detection
        - Automatic casting
        - Category encoding
        - Datetime parsing
    - Feature Transformation
      - Scaling Methods
        - Standardization
        - Normalization
        - Robust scaling
      - Encoding Techniques
        - One-hot encoding
        - Target encoding
        - Ordinal encoding
      - Dimensionality Reduction
        - Principal Component Analysis
        - Linear Discriminant Analysis
        - Autoencoders
  - Model Selection and Optimization
    - Algorithm Selection
      - Meta-Learning
        - Dataset characteristics
        - Historical performance
        - Transfer learning
      - Ensemble Methods
        - Voting classifiers
        - Stacking
        - Blending
    - Hyperparameter Tuning
      - Search Strategies
        - Grid search
        - Random search
        - Bayesian optimization
      - Optimization Algorithms
        - Tree-structured Parzen Estimators
        - Genetic algorithms
        - Simulated annealing
      - Search Spaces
        - Continuous parameters
        - Categorical parameters
        - Conditional parameters
      - Early Stopping
        - Performance-based
        - Time-based
        - Resource-based
- Applications and Use Cases
  - Industry Applications
    - Financial Services
      - Credit Scoring
        - Risk assessment
        - Default prediction
        - Loan approval automation
      - Fraud Detection
        - Transaction monitoring
        - Anomaly detection
        - Pattern recognition
      - Algorithmic Trading
        - Price prediction
        - Portfolio optimization
        - Risk management
    - Healthcare
      - Disease Prediction
        - Early diagnosis
        - Risk stratification
        - Treatment recommendation
      - Drug Discovery
        - Molecular property prediction
        - Target identification
        - Clinical trial optimization
      - Medical Imaging
        - Automated diagnosis
        - Segmentation tasks
        - Anomaly detection
    - Retail and E-commerce
      - Demand Forecasting
        - Inventory optimization
        - Supply chain management
        - Seasonal trend analysis
      - Customer Analytics
        - Churn prediction
        - Lifetime value estimation
        - Segmentation
      - Recommendation Systems
        - Product recommendations
        - Personalization
        - Cross-selling optimization
  - Technical Applications
    - Computer Vision
      - Image Processing
        - Feature extraction
        - Object detection
        - Semantic segmentation
      - Video Analytics
        - Motion detection
        - Activity recognition
        - Tracking systems
    - Natural Language Processing
      - Text Analytics
        - Sentiment analysis
        - Topic modeling
        - Named entity recognition
